About me

- Applied statistician working in genetics
- ► Write & support many open-source software packages
- ► Co-author on 170 papers and 1 book
- ► Reviewer for 90 different journals
- ► Formerly
 - Associate Editor and Senior Editor at Genetics
 - Associate Editor at Biostatistics
 - Associate Editor at Journal of the American Statistical Association
 - Academic Editor at PeerJ
 - Editorial Board member of BMC Biology

Data Organization in Spreadsheets

Karl W Broman^a and Kara H Woo^b

ARSTRACT

Spreadsheets are widely used software tools for data entry, storage, analysis, and visualization, Focusing on the data entry and storage aspects, this article offers practical recommendations for organizing spreadsheet data to reduce errors and ease later analyses. The basic principles are: be consistent, write dates like YYYY-MM-DD, do not leave any cells empty, put just one thing in a cell, organize the data as a single rectangle (with subjects as rows and variables as columns, and with a single header row), create a data dictionary, do not include calculations in the raw data files, do not use font color or highlighting as data, choose good names for things, make backups, use data validation to avoid data entry errors, and save the data in plain text files.

data organization organizing data in spreadsheets

My collaborators sometimes ask me, "In what form would you like the data?" My response is always, "In its current form!" If the data need to be reformatted, it's much better for me to write a script than for them to do a bunch of cut-and-paste. I'm a strong proponent of data analysts being able to handle any data files they might receive

But in many cases. I have to spend a lot of time writing scripts to rearrange the layout of the data. And how would you like your data analysts to spend their time? Reorganizing data, or really analyzing data?

Most of my collaborators enter and store their data in spreadsheets, and mostly Microsoft Excel. Before starting to enter data into a spreadsheet, it's good to spend some time thinking about the layout. The way that you organize the data in spreadsheets can have a big impact on your data analyst's quality of life.

This is a tutorial on that topic: how to organize data in spreadsheets. For complex, high-dimensional data, it may be better to use a formal database. But for many projects, spreadsheets are perfectly fine. But data in spreadsheets can be pretty and easy to work with, or they can be a sloppy mess requiring serious downstream reorganization efforts. We want to avoid the latter.

I don't think these ideas come naturally to anyone. So if you're not happy with the structure of your current data files, don't despair! And also don't apply tedious and potentially error-prone hand-editing to revise the arrangement. Rather, apply these principles when designing the layout for your next dataset, to help make analyses easier.

- Re consistent
- Write dates as YYYY-MM-DD.
- . Fill in all of the cells.

Data organization in spreadsheets

What's new?

- ► Rise of preprints in biology and medicine
- ► Rise of *Nature Communications*
- ► PubMed Central: expansion, with no embargo
- ▶ No longer stigma on OA
- ► Emphasis on computational reproducibility

What's not new?

- Attachment to Journal Impact Factor
- ► Attachment to Glam Journals
- ► Journal and conference spam
- ► The 20 open access enthusiasts on campus
- ► Researchers don't read much

Culture of open scholarship

- ► Community before individual
- ► Sharing makes better science
 - Data, methods, software, materials, manuscripts

Traditional scholarship

What's in it for me?

Barriers to open scholarship

- ► Focus on prestige
- Apathy
- Ignorance
- Concern about being scooped
- ▶ Cost
- ► Funding of scientific societies

How to persuade?

- ▶ Moral arguments
- ► Advantages for the researcher
- Institution policies
- ► Government policies

Privilege

white, male, US-born full professor in cargo shorts and a hoodie whose father was a university professor

Privilege
